6	Extras	19
6.1	Own project	19
6.2	Learn Git Branching	20

1 | Goal

In this lab we will learn the basic principles of version control [git](#) [1].

To begin, we will install and configure Git on your machine see Section 2. As well as create accounts on [Github](#) [2] and [Hevs Gitlab](#) [3].

In Section 3 we learn the basic operations to be able to work with Git.

The created repository will then be published on [GitHub](#).

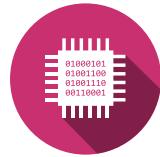

The advanced functions [branch](#) as well as [merge](#) will be tried in an example in Section 4.

In Section 5, we all work together using the gitflow principle.

Finally, there are some optional works in Section 6.

The answers to the questions should be written down in a Markdown file. The file should be named **answers.md**.

2 | Installation

The first step is to install Git as well as SublimeMerge.

2.1 git

You can download the latest version from the official website <https://git-scm.com/> [1]. Git is available for Linux, Mac, and Windows. This lab requires git \geq 2.27.

2.1.1 Command line

Start “Git Bash.” This is a Unix/Linux-like command editor that allows you to run Git commands in console mode. This is the interface we will use in this lab.

```
[z as — zas@zac — ~ — zsh — 99x52
Last login: Tue Mar  8 09:26:26 on ttys004
[z as@zac) [~] (base)
[ $ git --help
usage: git [--version] [--help] [-C <path>] [-c <name>=<value>]
           [--exec-path=<path>] [--html-path] [--man-path] [--info-path]
           [-p | --paginate | -P | --no-pager] [--no-replace-objects] [--bare]
           [--git-dir=<path>] [--work-tree=<path>] [--namespace=<name>]
           [--super-prefix=<path>] [--config-env=<name>=<envvar>]
           <command> [<args>]

These are common Git commands used in various situations:

start a working area (see also: git help tutorial)
clone      Clone a repository into a new directory
init       Create an empty Git repository or reinitialize an existing one

work on the current change (see also: git help everyday)
add        Add file contents to the index
mv        Move or rename a file, a directory, or a symlink
restore    Restore working tree files
rm        Remove files from the working tree and from the index

examine the history and state (see also: git help revisions)
bisect    Use binary search to find the commit that introduced a bug
diff      Show changes between commits, commit and working tree, etc
grep      Print lines matching a pattern
log       Show commit logs
show      Show various types of objects
status    Show the working tree status

grow, mark and tweak your common history
branch   List, create, or delete branches
commit   Record changes to the repository
merge    Join two or more development histories together
rebase   Reapply commits on top of another base tip
reset   Reset current HEAD to the specified state
switch  Switch branches
tag     Create, list, delete or verify a tag object signed with GPG

collaborate (see also: git help workflows)
fetch   Download objects and refs from another repository
pull    Fetch from and integrate with another repository or a local branch
push    Update remote refs along with associated objects

'git help -a' and 'git help -g' list available subcommands and some
concept guides. See 'git help <command>' or 'git help <concept>'
to read about a specific subcommand or concept.
See 'git help git' for an overview of the system.

[z as@zac) [~] (base)
[ $
```

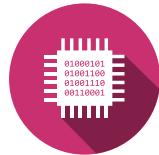

Figure 1 - git Terminal

Note that for all commands in Git Bash, you can get help by inserting **--help** after the command.

```
1 git --help
```

Bash

2.1.2 Global configuration

A variety of settings can be configured in Git. It is possible to change the settings globally on your computer (flag `--global`) or only for a specific repository.

We will now perform the minimal configuration. Use the following commands to set your identity in Git globally on the system. Use your name and email address. This information is publicly visible to identify your work (your commits).

```
1 git config --global user.name "Firstname Lastname"
2 git config --global user.email first.last@email.ch
```

Bash

You can check the configuration with the following command:

```
1 git config --list
```

Bash

You can also check a specific setting:

```
1 git config user.name
```

Bash

2.2 Sublime Merge

Visit the website <https://www.sublimemerge.com> and download and install the Sublime Merge tool [4].

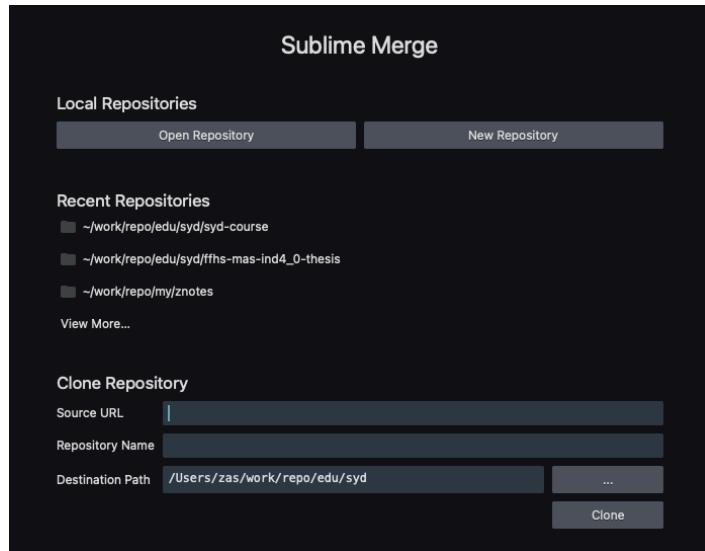

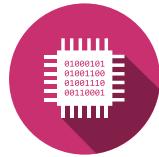

Figure 2 - Sublime Merge GUI

2.3 Online accounts

2.3.1 Gitlab

Visit like website <https://gitlab.hevs.ch> and log in with your school account (SwitchEDU-ID).

Hi there!

Welcome to the [GitLab](#) server of the HES-SO Valais/Wallis.

Here you can [learn](#) all about git. For the impatient we recommend [these](#) excellent video tutorials.

If you need a graphical git client, we recommend [Tower](#) for Windows and macOS. Use the following [link](#) to obtain a license (only HES-SO Valais/Wallis employees). An alternative git client is [Fork](#).

LDAP	Standard
LDAP Username <input type="text" value="silvan.zahno"/> Password <input type="password" value="*****"/> <input type="checkbox"/> Remember me <input type="button" value="Sign in"/>	

Table 1 - Gitlab Login

2.3.2 Github

Visit like website <https://github.com> and create an account and log in.

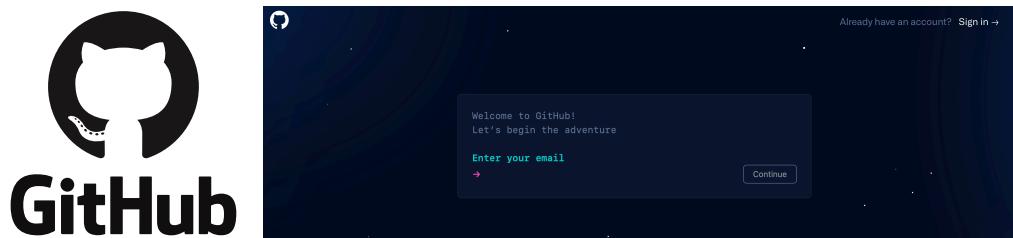

Table 2 - GitHub Login

2.4 Windows Configuration

In order to see also the hidden `.git/` folder as well as file extentions. Configure your Windows File Explorer as follows Figure 3:

File Explorer \Rightarrow View \Rightarrow Show \Rightarrow Activate “**File name extensions**” and “**Hidden items**”

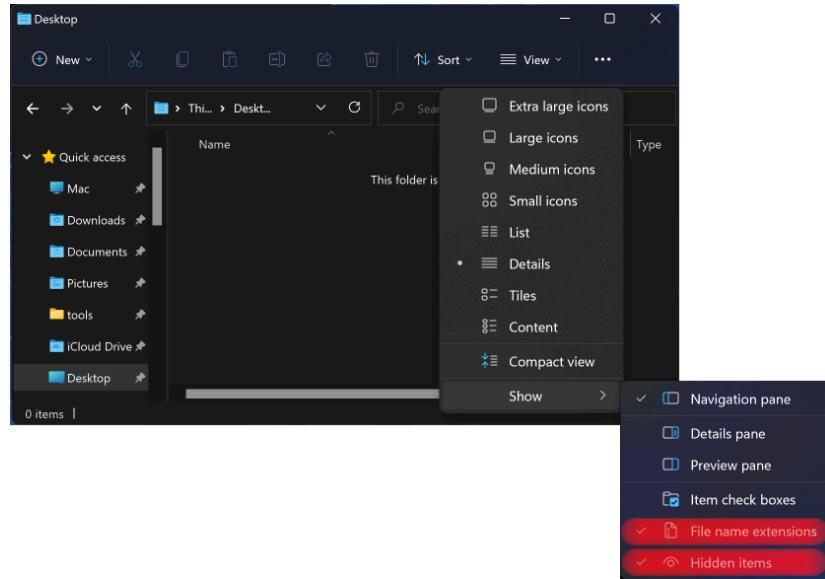

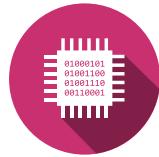

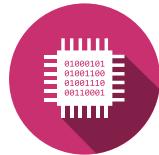

Figure 3 - Windows File Explorer Configuration

3 | Basic operations

3.1 Create a git repository.

Using the Git Bash console, create an empty directory on your computer, for example `C:\temp\gitRepo` or `~/tmp/gitRepo`. This directory will be your git repository.

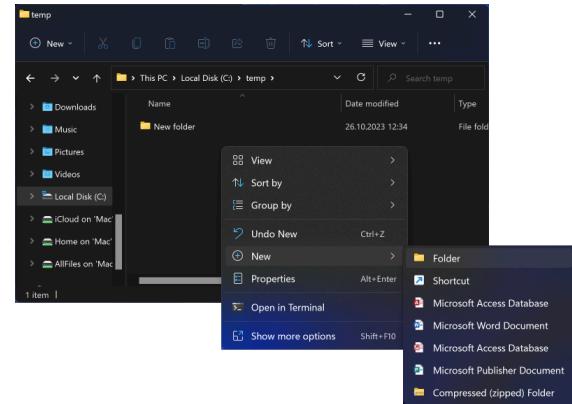

You can use the Unix/Linux commands `ls` (list files and directories), `cd` (change directory), `pwd` (print current working directory), and `mkdir` (make directory) to create this directory.

Commandline

```
1 mkdir -p c:/temp/gitRepo
2 cd c:/temp/gitRepo
```

GUI

`C:\temp` \Rightarrow New \Rightarrow Folder \Rightarrow `gitRepo`

3.2 Initialize

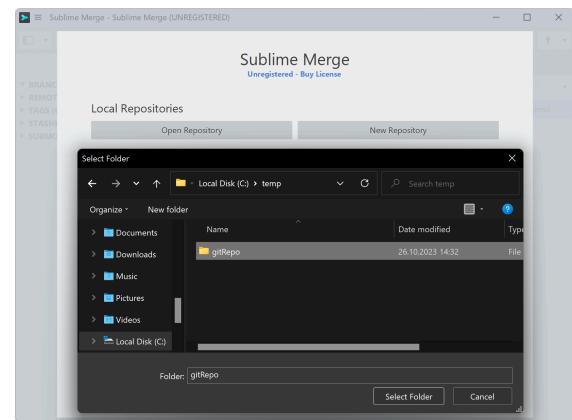

Once you are in that directory, initialize it as a git repo with the command:

Commandline

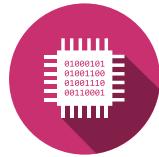

```
1 git init
```

GUI

`CTRL+T` \Rightarrow New Repository \Rightarrow Select Folder

What changed in the directory after you initialized it as a git repo?

Write down the answer!

3.3 Get status

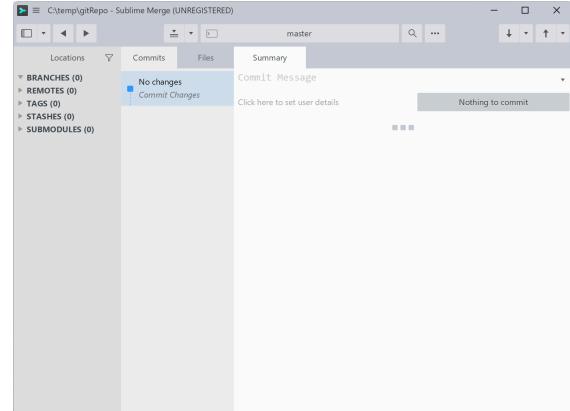

Get information about your repo with the following commands:

Commandline

```
1 git status
2 git log --oneline
```

GUI

See the status in the main window.

3.4 Add file

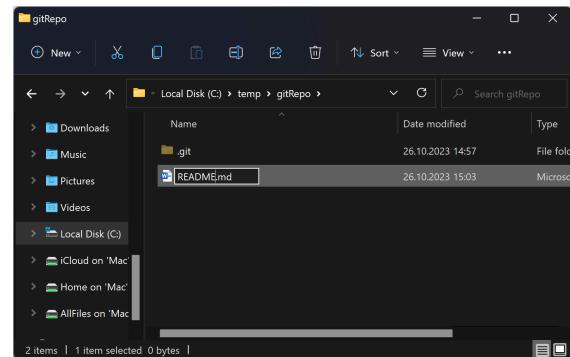

Now create an empty file named **README.md** in the root directory of your repo.

Commandline

```
1 touch README.md
```

GUI

C:\temp \Rightarrow New \Rightarrow Any File \Rightarrow README.md

Use the previous command to retrieve the information about your repo again. What has changed?

Write down the answer!

Your local git repo consists of three areas that are maintained by git:

- Working directory is a directory that contains the current version of your files (a normal file directory in the eyes of your operating system).
- Stage contains the changes to be included in the next commit;
- Head points to the location in the Git repo tree where the next commit should be made.

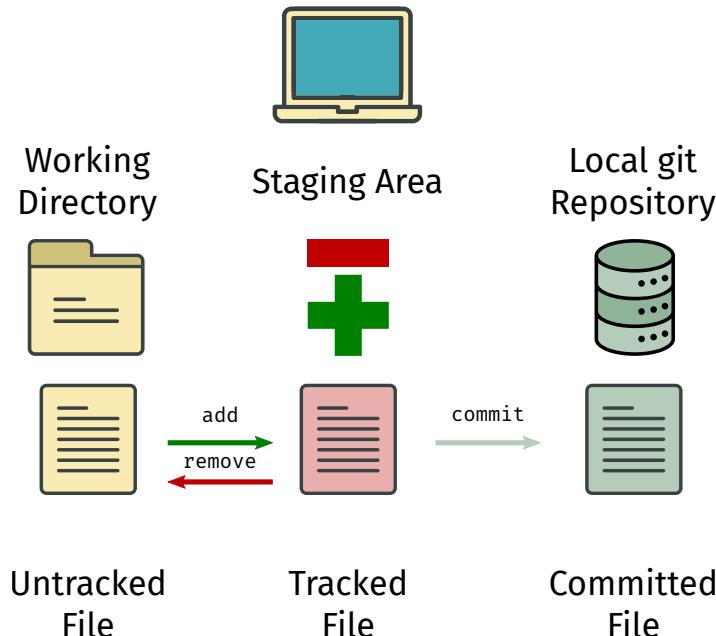

Figure 4 - Types of local Git operations

A simple Git repo consisting of five commits can be represented as follows. The **Head** position is a reference to a commit that represents the current state/view of the repo, in this case the latest change.

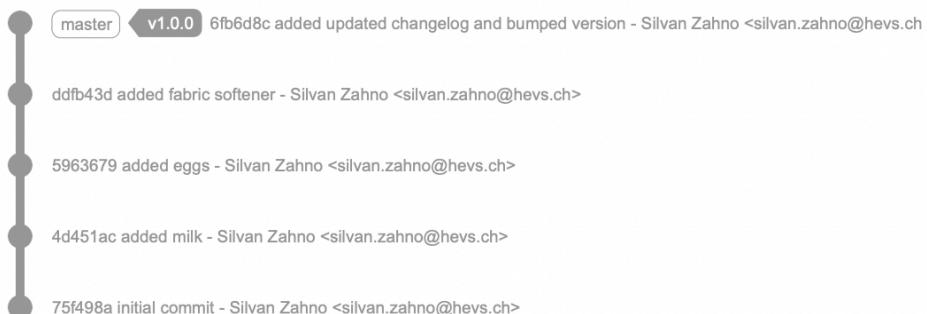

Figure 5 - Five commits on the local repo, each commit has its own identification

3.5 Add file to repo

Add the previously created file **README.md** to the stage with the command:

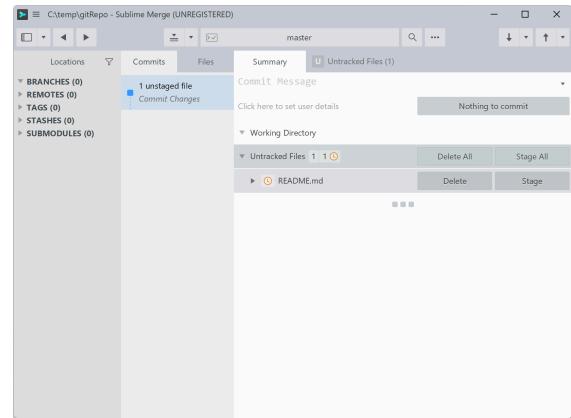

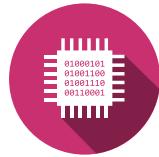

Commandline

```
1 git add README.md
```

GUI

Untracked Files ⇒ **README.md** ⇒ **Stage**

Bash

Retrieve the information about your repo again, what do you find?

Write down the answer!

Edit the file **README.md** with a texteditor and insert the following text (markdown syntax):

```

1
2 # Title of my readme
3 Text and more text, followed by a small list :
4   * Item 1
5   * Item 2
6   * Item 3
7
8 And finally a little code:
9 ````sh
10 $ cd myDir
11 $ git init
12 $ git status
13 $ ls -al
14 ````
```

Markdown

Get the information about your repo again, what do you find?

Write down the answer!

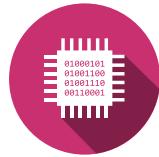

3.6 Add new changes

Add the latest version of the **README.md** file to the stage.

Commandline

GUI

Untracked Files \Rightarrow **README.md** \Rightarrow **Stage**

1 `git add README.md`

Bash

3.7 Execute commit

Now perform a commit with the following command:

Commandline

```
1 git commit -m "Initial commit.  
Add README file."
```

Bash

GUI

Commit Message \Rightarrow **Initial commit. Add README file.** \Rightarrow **Commit 1 file**

The `-m` option allows to specify the message of the commit directly. This message must be self-explanatory. It corresponds to the description of the changes. It is possible to insert a text block e.g. via a text editor without using the `-m` option.

Your changes are now published to your local git repo. Bravo.

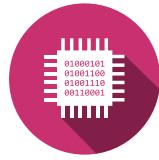

3.8 More information

What information can you get now with the command:

Commandline

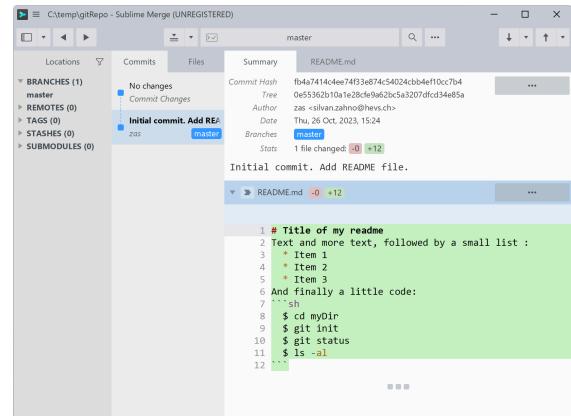

GUI

Select First Commit \Rightarrow **See all informations**

```
1 git log --oneline
```

Bash

The screenshot shows the Sublime Merge interface with the following details:

- BRANCHES (1)**: master
- REOTES (0)**
- TAGS (0)**
- STASHES (0)**
- SUBMODULES (0)**
- Commits** tab selected.
- Initial commit. Add README.md** (zas) is listed under Commit Changes.
- Summary** tab selected.
- Commit Hash**: fb4a7414c4ee74f33e874c54024ccb4ef10cc7b4
- Tree**: 0e55362b10a1e2bcfe9a62bc5a3207dfcd34e85a
- Author**: zas <silvan.zehno@hevs.ch>
- Date**: Thu, 26 Oct, 2023, 15:24
- Branches**: master
- Stats**: 1 file changed. +0 -12
- Initial commit. Add README file.**
- File Content Preview** (README.md):

```
1 # Title of my readme
2 Text and more text, followed by a small list :
3 * Item 1
4 * Item 2
5 * Item 3
6 And finally a little code:
7 ````sh
8 $ cd moplr
9 $ git init
10 $ git status
11 $ ls -al
12 ````
```

Clearly explain all the information in this line.

Write down the answer!

3.9 More commits

Perform another commit to add a new (empty) `hello_world.py` file to your repo.

Now what new information does the command give you:

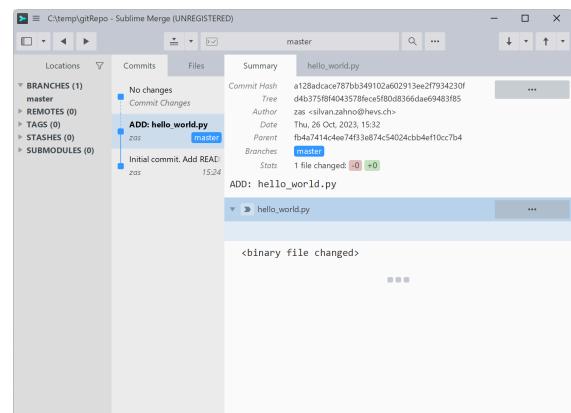

Commandline

```
1 git log
```

Bash

GUI

Select Second Commit ⇒ See all informations

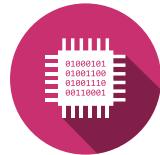

The screenshot shows the Sublime Merge interface with the following details:

- BRANCHES (1)**: master
- REOTES (0)**
- TAGS (0)**
- STASHES (0)**
- SUBMODULES (0)**
- Commits** tab selected.
- ADD: hello_world.py** (zas) is listed under Commit Changes.
- Summary** tab selected.
- Commit Hash**: a238adade787b349102a602012ee2f7934230f
- Tree**: d4b375fb04a3579ec59008366daed69493f05
- Author**: zas <silvan.zehno@hevs.ch>
- Date**: Thu, 26 Oct, 2023, 15:32
- Parent**: fb4a7414c4ee74f33e874c54024ccb4ef10cc7b4
- Branches**: master
- Stats**: 1 file changed. +0 -0
- ADD: hello_world.py**
- File Content Preview** (<binary file changed>)

Write down the answer!

Note that each commit is provided with a “hash” or “checksum” (of type sha1). The hases shown with the command:

```
1 git log --oneline
```

Bash

are only the first few characters of these so-called “short hashes”.

3.10 Checkout commit

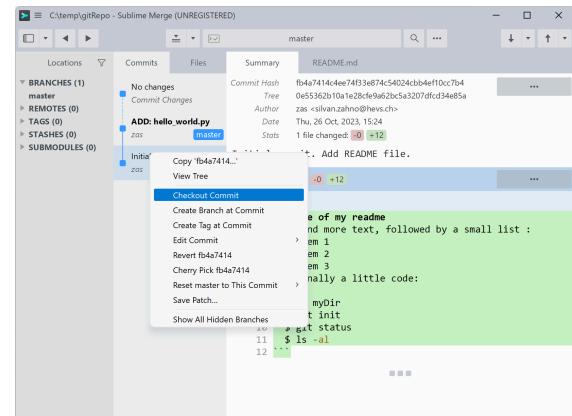

Now do a checkout with the following command using the “short hash”, which corresponds to your first commit.

Commandline

```
1 git checkout <SHA1> -b
inspectingPrev
2 # for example
3 git checkout fb4a741 -b inspectingPrev
```

GUI

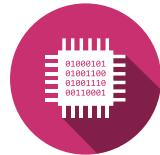

Select First Commit \Rightarrow Checkout commit

Now what do you notice when you call the contents of the working directory?

Write down the answer!

3.11 Checkout master

Now run a checkout with the following command:

Commandline

```
1 git checkout master
```

GUI

Branches (1) ⇒ master ⇒ checkout master

The screenshot shows a Sublime Merge interface with a commit history for a file named README.md. The commit details are as follows:

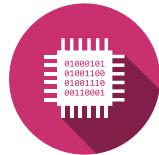

- Commit Hash: fb4a7414c4ee74f33e874c54024ccb4ef10cc7b4
- Tree: 0e55362b10a1e2bce962bc5a3207dfcd34e85a
- Author: zas <silvan.zehn@hevs.ch>
- Date: Thu, 26 Oct, 2023 15:24
- Stats: 1 file changed +0 -12

The status bar at the bottom of the code editor indicates "Initial commit. Add README file." and shows a green background with the text "1 # Title of my readme" and "12".

Now what do you notice when you look at the contents of the working directory?

Write down the answer!

4 | Branch and Merge

So far we have used the basic functions of Git. There are also the branch and merge functions, which Git has greatly simplified compared to the tools that existed earlier.

For this hands-on work, you can use the Sublime Merge GUI, which gives you a graphical representation and visual history of the commits in your repo.

1. Create a Github repo and add it as a remote

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository](#).

Required fields are marked with an asterisk (*).

Repository template

No template

Start your repository with a template repository's contents.

Owner * tschinz / **Repository name *** gitRepo

gitRepo is available.

Great repository names are short and memorable. Need inspiration? How about [stunning-octo-bassoon](#) ?

Description (optional)

test repo for course SyD

Public Anyone on the internet can see this repository. You choose who can commit.

Private You choose who can see and commit to this repository.

Initialize this repository with:

Add a README file

This is where you can write a long description for your project. [Learn more about READMEs](#).

Add .gitignore

.gitignore template: None

Choose which files not to track from a list of templates. [Learn more about ignoring files](#).

Choose a license

License: None

A license tells others what they can and can't do with your code. [Learn more about licenses](#).

① You are creating a public repository in your personal account.

Create repository

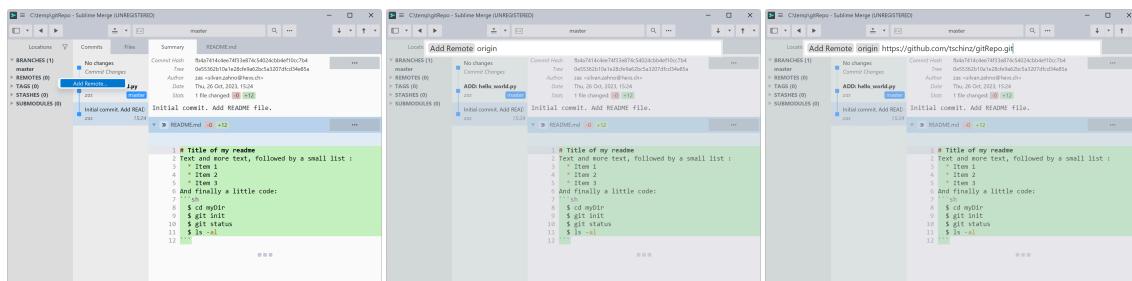

Commandline

```
1 git remote add origin https://github.com/<username>/<reponame>.git
```

Bash

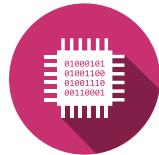

GUI

Remotes (0) ⇒ Add Remote... ⇒ Remote name ⇒ origin ⇒ Remote URL ⇒ <https://github.com/<username>/<reponame>.git>

2. Create a development branch **dev01** in your local repo.

3. Create two commits on this branch:

- One to create a file **hello_world.py** (This commit already exists).
- One to populate this file **hello_world.py**.

```
1 print("Hello, world!")
```

Python

4. Checkout the **master** branch
5. From the **master** branch, create a new development branch **dev02**.
6. Edit the **README.md** file and create a commit on the branch **dev02**.
7. Merge the branch **dev02** into **master**.
 - Checkout the **master** branch
 - Perform a merge “merge **dev02** into **master**”
8. Merge the branch **dev01** into **master**.
 - Checkout the **master** branch
 - Perform a merge “merge **dev01** into **master**”
9. Push your local repository to your GitHub remote.

```
1 git push origin master
```

Shell

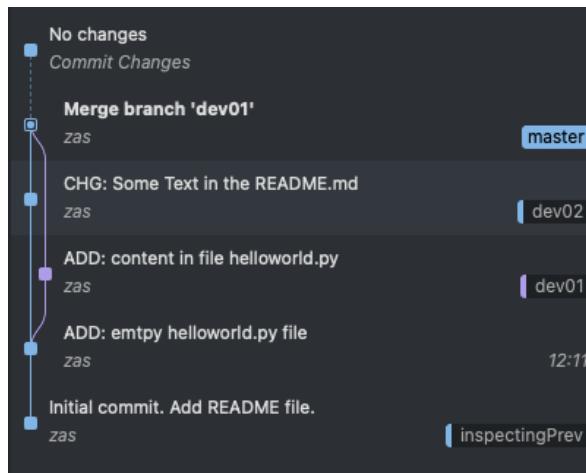

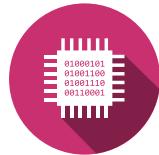

Figure 7 - Status after repo branches **dev01** and **dev02** have been merged

5 | Gitflow

For this task, use the Gitflow philosophy presented in the course. You will all collaborate on the following Git repo as if you were forming a development team:

<https://github.com/tschinz/gitflow> [5]

This is a public Git repo hosted on Github.

5.1 Fork

For security reasons, you are not allowed to work directly on this repository. You need to create your own copy (fork) in order to make changes. Therefore, please create a “fork” of this repository in your GitHub account. To do this, use the “Fork” button in the Github web interface.

The screenshot shows the GitHub repository page for 'tschinz/gitflow'. At the top, there are buttons for Pin, Unwatch (with 1 watch), Fork (highlighted with a red box), Star (0 stars), and more. Below the header, there are tabs for Code, Issues, Pull requests, Actions, Projects, Wiki, Security, and more. Under the 'Code' tab, it shows 1 branch and 0 tags. A recent commit by 'tschinz' titled 'ADD: Team.md' is listed, made 3fd8c32 2 minutes ago with 1 commit. Below the commit, there are links for 'Team.md' and 'ADD: Team.md', both updated 2 minutes ago. A callout box says 'Help people interested in this repository understand your project by adding a README.' On the right side, there are sections for 'About', 'Releases', and 'Packages', each with their respective counts and links.

Figure 8 - Fork button for a GitHub repository

Next, clone our shared repository. The URL of your repository will look similar to:

```
1 git clone https://github.com/<username>/gitflow.git
```

Bash

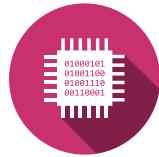

5.2 Parallel collaboration

In a local feature branch, edit the **Team.md** file. Replace your given number with your first name and last name.

You will all edit the same file. To avoid conflicts, edit only the line that is relevant to you.

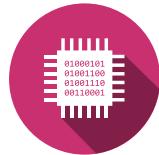

“Commit” and “push” your branch to the fork repository on GitHub.

5.3 Pull Request

Create a “pull request” (merge request) on GitHub. Use the interface on the GitHub website to do this.

Once all pull requests are ready, merges will be done in consultation with the entire group (and teachers).

6 | Extras

This optional chapter can be started provided the previous tasks have been completed. There are 2 tasks to do:

1. Put your own project on Github and provide it with a **README.md** and a CI/CD.
2. Follow the “Learn Git Branching” website

6.1 Own project

- Put a current project you are working on, on github.
- Create a **README.md** file for the project using the [Markdown Syntax](#). The **README.md** should include the following:
 - Title
 - Image
 - Description of the project
 - Explanation how to run / use the project
 - List of authors
- Now create a github action to turn the **README.md** into a PDF on every push. For this find a suitable [github action](#) and add it to your project.

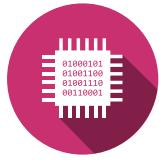

If you need help to create the github actions. Checkout the following [hint](#).

The screenshot shows the GitHub Marketplace interface. The left sidebar has a 'Types' dropdown with 'Actions' selected. Below it is a list of categories: Apps, API management, Chat, Code quality, Code review, Continuous integration, Dependency management, Deployment, IDEs, Learning, and Localization. The main area has a search bar with 'Type [] to search' and a 'Sort: Best Match' dropdown. A message says 'An entirely new way to automate your development workflow.' Below it, a search bar shows 'Search for apps and actions' with 'Actions' selected. The results section is titled 'Actions' and shows '20351 results filtered by Actions'. Four actions are listed:

- Close Stale Issues** By actions (Creator verified by GitHub) Close issues and pull requests with no recent activity 1.1k stars
- Upload a Build Artifact** By actions (Creator verified by GitHub) Upload a build artifact that can be used by subsequent workflow steps 2.5k stars
- Download a Build Artifact** By actions (Creator verified by GitHub) Download a build artifact that was previously uploaded in the workflow by the upload-artifact action 1.1k stars
- Setup Java JDK** By actions (Creator verified by GitHub) Set up a specific version of the Java JDK and add the command-line tools to the PATH 1.3k stars

Figure 9 - GitHub Action Marketplace

6.2 Learn Git Branching

Follow the Tutorial on <https://learngitbranching.js.org>.

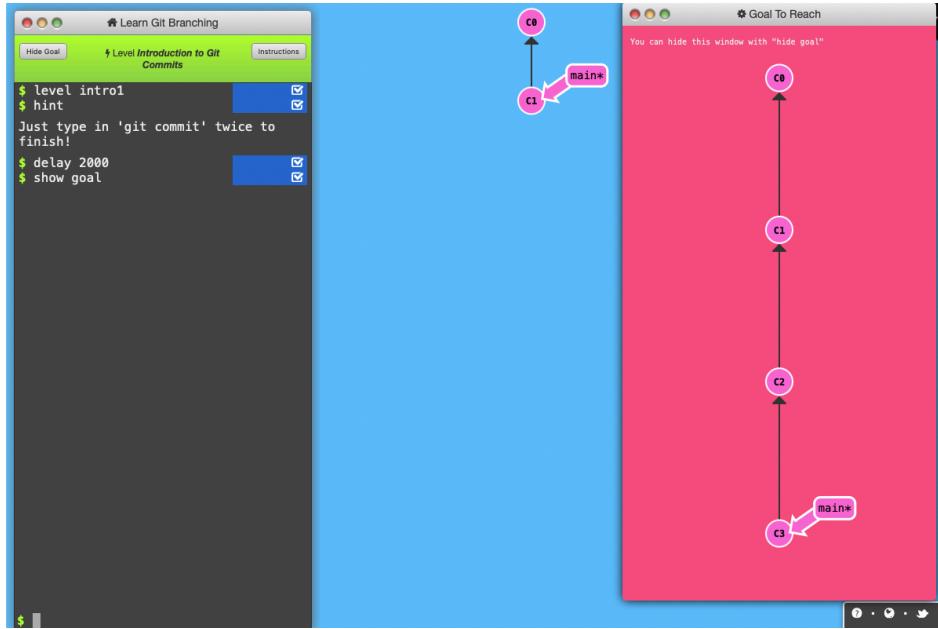

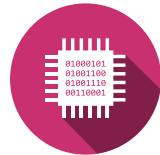

Figure 10 - Learn git branching website

A | GIT commands

[Github git cheatsheet](#) [6], [7]

AA Review changes and make a commit transaction.

```
1 git status
```

Bash

Lists all new or changed files ready for commit.

```
1 git diff
```

Bash

Displays file changes that have not yet been indexed.

```
1 git add [file]
```

Bash

Indexes the current state of the file for versioning.

```
1 git diff --staged
```

Bash

Shows the differences between the index (“staging area”) and the current file version.

```
1 git reset [file]
```

Bash

Takes the file from the index, but preserves its contents.

```
1 git commit -m "[descriptive message]"
```

Bash

Adds all currently indexed files permanently to the version history.

AB Synchronize changes

Register an external repository (URL) and swap the repository history.

```
1 git fetch [remote]
```

Bash

Downloads the entire history of an external repository.

```
1 git merge [remote]/[branch]
```

Bash

Integrates the external branch with the current locally checked out branch.

```
1 git push [remote] [branch]
```

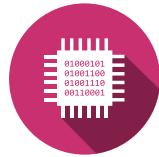

Bash

Pushes all commits on the local branch to GitHub.

```
1 git pull
```

Bash

Pulls the history from the external repository and integrates the changes.

B | Most used Git commands

BA Start a working area

- [clone](#) - Clone a repository into a new directory
- [init](#) - Create an empty Git repository or reinitialize an existing one

BB Work on the current change

- [add](#) - Add file contents to the index
- [mv](#) - Move or rename a file, a directory, or a symlink
- [reset](#) - Reset current HEAD to the specified state
- [rm](#) - Remove files from the working tree and from the index

BC Examine the history and state

- [log](#) - Show commit logs
- [show](#) - Show various types of objects
- [status](#) - Show the working tree status

BD Grow, mark and tweak your common history

- [branch](#) - List, create, or delete branches
- [checkout](#) - Switch branches or restore working tree files
- [commit](#) - Record changes to the repository
- [diff](#) - Show changes between commits, commit and working tree, etc
- [merge](#) - Join two or more development histories together
- [rebase](#) - Reapply commits on top of another base tip
- [tag](#) - Create, list, delete or verify a tag object signed with GPG

BE Collaborate

- [fetch](#) - Download objects and refs from another repository
- [pull](#) - Fetch from and integrate with another repository or a local branch
- [push](#) - Update remote refs along with associated objects
